Value analysis of urban	Melbourne Water	Yarra Valley Water; The University of Melbourne;
greening on private land		Moonee Valley City Council

Priority Urban Greening Analysis

Identify and cost priority urban greening opportunities on public and private land across metropolitan Melbourne, primarily to:

- reduce urban heat for vulnerable communities
- protect biodiversity and provide enhanced habitat
- enhance priority passive open spaces to cool those places.
- protect the health of waterways, riparian corridors and aquatic ecosystems
- identify the intersection with integrated water management opportunities

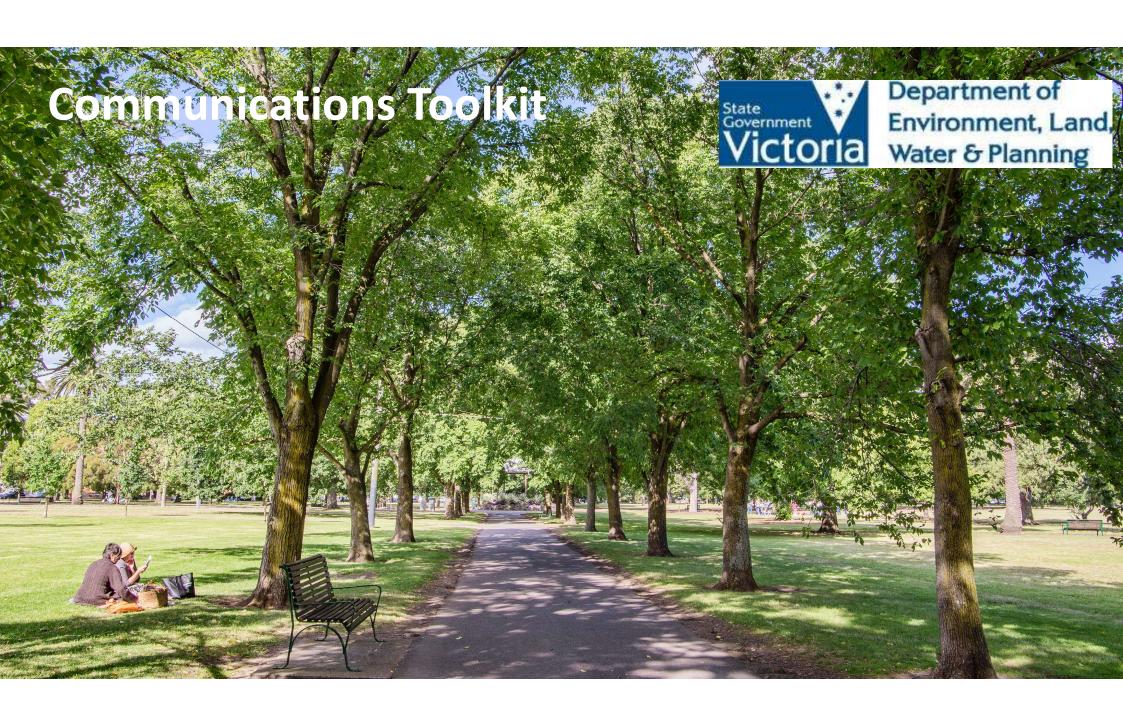

• The purpose of this feasibility study would be to support a business case / prospectus for funding bids at various geographic scales.

We wanted to provide the evidence and narrative that:

- urban greening for heat mitigation and habitat connectivity could be prioritised
- 2. the costs of urban greening could be substantial
- 3. the cost-benefit of urban greening was positive i.e. good value for money (4:1 positive benefit)

These goals were achieved in this project.
